

Statistics

Statistics is the science of collecting, organising, and analysing data.

Data \rightarrow Facts or pieces of information.

ex - Ages of students in a class

{24, 30, 21, 34, 20} \Rightarrow Mean, Median etc \Rightarrow Analysis

ex - weights of students in a class

{75, 45, 50, 55, 60}

diagram

Statistics (2 types)

Descriptive

It consists of organising and summarizing of data

ex:-

Pie chart

Box plot

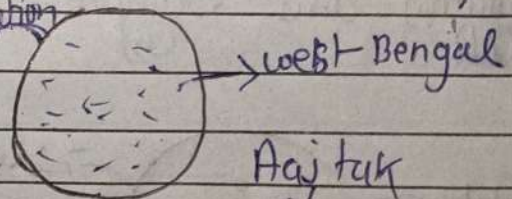

Candlestick

Inferential stats.

It consists of a technique by ~~creating some ex.~~ to form some conclusion.

ex:- election is happening

population

Exit poll

took sample of data

perform some hypothesis testing

ex:- p-value, t-test, t-test, chi square, Anova etc.

Conclusion

3

Interview question Amazon

★ What is the avg. size of all sharks in the world?

#example :- Let's say there are 20 classrooms in a university and you have collected the age of students in one classroom.

Age {21, 20, 18, 34, 17, 22, 24, 25, 26, 23, 22}

Descriptive Statistics - What is the avg. age of the students in the classroom??

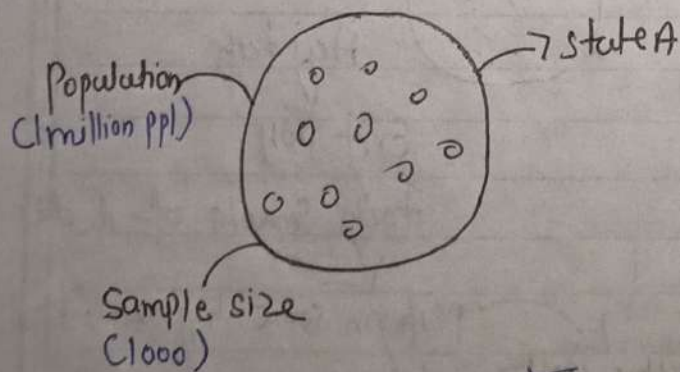

Minimum age, outliers, Distribution, Transformation, mean age

Inferential Statistics - Are the avg age of the Students ^{Sample} in the classroom equal to the avg. ages of the entire uni? ^{Population data.}

Population (N) and Sample (n)

eg:- Exit poll of state

{ Avg. height of all the people in the state??

Sample ^{Avg height} → population

Sampling Techniques.

1) Simple Random Sampling - Every member of the population (N) has an equal chance of being selected for your sample (n).

eg:- Tossing a coin

$$\text{Head} = \frac{1}{2}, \text{tail} = \frac{1}{2}$$

ex:- if there are 1000 people in a country then the probability of being selected is $\frac{1}{1000}$.

↓ ages → non overlapping.

2) Stratified Sampling -

eg- Gender $\begin{cases} \text{Female} \\ \text{male} \end{cases}$, Blood groups $\begin{cases} A+ \\ O+ \\ B+ \end{cases}$

3) Systematic Sampling -

ex:-

Bangalore airport

SBI credit
card stall

(n th person selected)

every 5th person

they decide
how they select
people

(N) → selects every n th person.

every 7th person

(5)

4) Convenience Sampling. — only those people who are interested will only be participating.

ex - Survey regarding new technology.

Variables.

A variable is a property that can take on any value.

ex - Age = 24
Age = 25

Two Kinds of variable

1) Quantitative variable.

Measured Numerically (Add, SUB, \times and \div)

2) Qualitative variable \Rightarrow Categorical variable

ex - Gender $\left\{ \begin{array}{l} \text{female} \\ \text{male} \end{array} \right.$

ex Types of flowers $\left\{ \begin{array}{l} \text{rose} \\ \text{lily} \\ \text{lotus} \\ \text{sun} \end{array} \right.$

$\left\{ \begin{array}{l} \text{Based on some characteristics we} \\ \text{can group categorical variable.} \end{array} \right.$

Quantitative Variable

Discrete

ex - whole no.

0, 1, 2, 3, 4, ... etc but

not 0.1, 0.3, 1.1 etc.

Continuous.

eg - height, weight etc

1.72 cm, 150.5 cm etc

Histogram { Construct a histogram }

continue

Ages = { 10, 12, 14, 18, 24, 26, 30, 35, 36, 37, 40, 41, 42, 43, 50, 51, 65, 68, 78, 90, 95, 100 }

- ① Sort the no. in ascending order
- ② Bins ~~area~~ ^{no. of groups} or gaps
- ③ Bin size \rightarrow Size of bins

ex - Suppose

[0 - 100]

Bins = 10

$$\text{Bin size} = \frac{100}{10} = 10$$

(Smoothing histogram)

ex - [0 - 100]

Bins = 20

$$\text{Bin size} = \frac{100}{20} = 5$$

ex [0 - 100]

Bins = 5

$$\text{Bin size} = \frac{100}{5} = 20$$
